TTC 2015 background

8th Transformation Tool Contest

Task: execution of *fUML Activity Diagrams*.

8th Transformation Tool Contest

2. The action *register* consumes the token *c1*, executes the defined expression leading to an update of the variable *non-internal*, creates the control token *c2*, and offers it to the decision node *decision*.

3. The decision node *decision* offers the control token *c2* to the opaque action *get welcome package*, because the variable *internal* defined as guard condition has the current value *true*.

4. The action *get welcome package* consumes the control token *c2*, produces the control token *c3*, and offers it to the fork node.

5. The fork node *fork* produces the forked token *c4* for the incoming control token *c3* (i.e., the forked token's base token). The remaining offers count is set to 2, because the fork node has two outgoing control flow edges. The forked token *c4* is offered to the successor actions via two distinct offers.

6. The action *assign to project* consumes its token offer for *c4* leading to an update of *c4*'s remaining offers count to 1, produces the control token *c5*, and offers it to the join node *join*.

7. The action *add to website* consumes its token offer for *c4* leading to an update of *c4*'s remaining offers count to 0, which in turn leads to the withdrawal of *c4* (*holder* is set to *null*). Furthermore, it produces the control token *c6*, and offers it to the join node.

8. The join node *join* offers the incoming tokens *c6* and *c7* via one offer to the action *manager interview*.

9. The action *manager interview* consumes the control tokens *c5* and *c6*, produces the control token *c7*, and offers it to the action *manager report*.

RACR solution background

General solution idea

Interpreter consisting of two parts ...

- *Activity Diagram* → Petri net compiler (**analyses**)
- Petri net interpreter (**state transformations**)

... implemented using RAG-controlled rewriting.

RAG-controlled rewriting

- RAG-controlled rewriting = RAGs + graph rewriting
 - reference attribute grammar for declarative analyses
 - reference attributes induce semantic overlay graph on top of abstract syntax tree (AST) >> extend AST to ASG
 - enables deduction *and* analyses of graph structure
 - >> deduced, memoized abstract syntax graph (ASG)
 - graph rewriting for declarative ASG transformations
 - left hand: ASG pattern (ASTs connected via reference attributes)
 - right hand: manipulations on matched, underlying AST
 - >> ASG changes with AST (updated by RAG)
 - seamless combination:
 - use of analyses to deduce rewrites
 - rewrites automatically update analyses
 - >> incremental

} mutual control

RACR

- reference implementation of RAG-controlled rewriting in *Scheme*
- *R6RS* library; API for:
 - ASG schema definition (AST schema + attribution)
 - ASG querying (AST + attributes)
 - rewriting (imperative/RAG-controlled/fixpoint; primitive/pattern-based; or combination of all)

Solution

fUML Activity Diagram compiler

- attributes for:
 - name analysis (symbolic name resolution)
 - incoming & outgoing edges
 - variables
 - type analysis (expression types)
 - well-formedness analysis (only *TTC* solution that rejects malformed diagrams)
 - code generation (i.e., Petri net generation)

} reference attributes

fUML Activity Diagram \rightarrow Petri net

fUML Activity Diagram \rightarrow Petri net

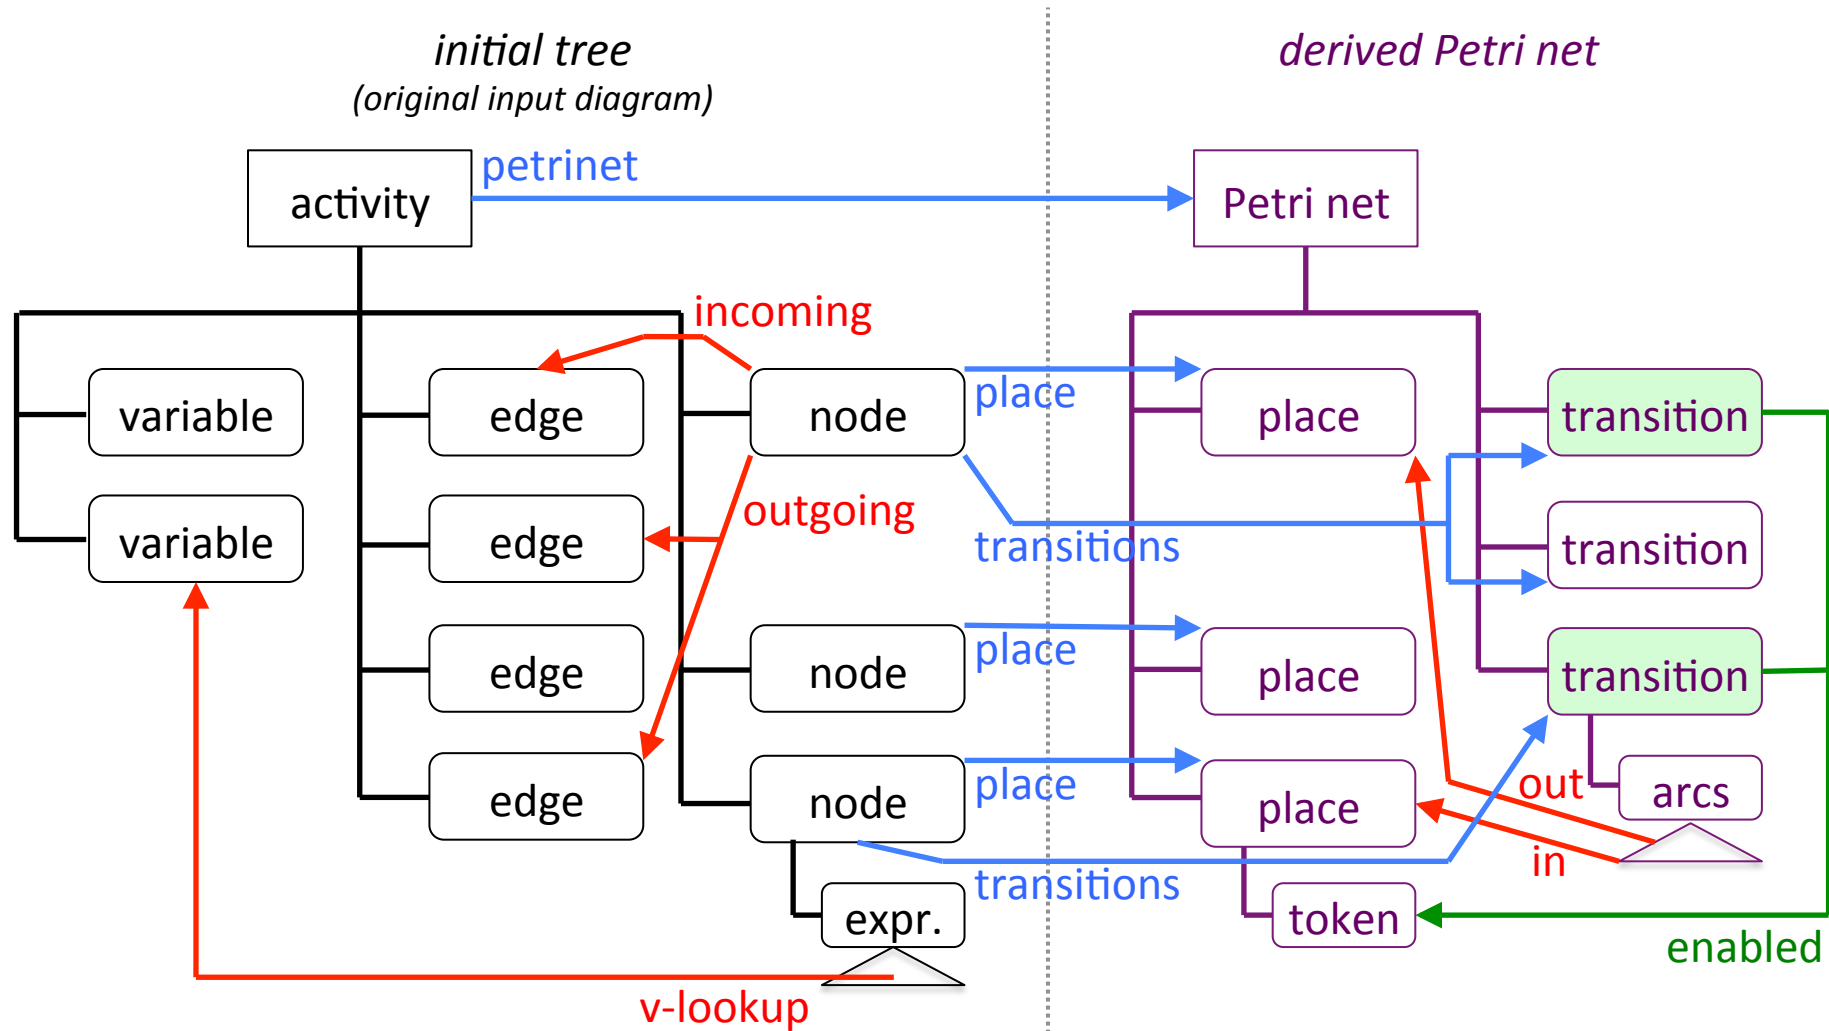

Petri net interpreter

- attributes for:
 - name analysis
 - well-formedness analysis
 - enabled analysis (kind of name analysis)
- rewrites for execution (firing)
 - delete consumed tokens
 - add produced tokens

Abstract syntax graph

semantic overlay graph (excerpt): ■ name analysis ■ code generation ■ enabled analysis

Execution (RAG-controlled rewriting)

semantic overlay graph (excerpt): ■ name analysis ■ code generation ■ enabled analysis

Execution (RAG-controlled rewriting)

semantic overlay graph (excerpt): ■ name analysis ■ ■ code generation ■ enabled analysis

Evaluation

Implementation quality

- straightforward rewriting thanks to attribute-based analysis (rewrites leverage on analyses)
- focused rewriting (just actual state changes)
- efficient, although naïvely specified (incremental)
- declarative (automatic deduction of evaluation orders for intertwined analyses & rewriting)
- interactive (convenient runtime API for user-driven analyses & state changes)

Lines of code

Source code file	Solution part (language task)	LOC	
<i>Activity Diagram interpreter (584):</i>		548	
<i>analyses.scm: 308</i>	AST scheme	16	3%
	ASG accessors (constructors, child & attribute accessors)	89	16%
	Name analysis	36	7%
	Type analysis	21	4%
	Well-formedness	30	5%
	Petri net generation	94	17%
<i>parser.scm: 234</i>	Parsing	229	42%
<i>user-interface.scm: 42</i>	Initialisation & command-line interface	33	6%
<i>Petri net interpreter (243):</i>		222	
<i>analyses.scm: 134</i>	AST scheme	6	3%
	ASG accessors (constructors, child & attribute accessors)	34	15%
	Query support	12	5%
	Name analysis	19	9%
	Well-formedness	12	5%
	Enabled analysis	38	17%
<i>user-interface.scm: 109</i>	Initialisation and Petri net syntax	32	15%
	Running and firing interface	14	6%
	Read-eval-print-loop interpreter	23	10%
	Testing (marking & enabled status)	32	15%
